

Lab 01 - Prompt and Specification Pack

Vision-System Needs Analysis and Generative Pipeline Specification Generative AI for Image and Video Creation (TGS-2020505925) | Version v11.0 | 6 September 2026

Lab 01 is an analysis lab, so the 'prompts' here are the structured briefing and review prompts you would put in front of a stakeholder or an assistant model. They are reusable templates - nothing here requires a paid service.

Currency note. Model identifiers and API parameters quoted anywhere in this pack were verified against the official vendor documentation on 6 September 2026. Model IDs change; re-verify before relying on one. Identifiers known to be deprecated are marked as such rather than quietly removed, so you can recognise them in older material.

Stakeholder needs-elicitation prompt

Use this verbatim in the discovery meeting. It forces the six criteria out of a vague request.

You have asked for AI-generated imagery for <use case>.
Before specifying a pipeline, provide six evidence fields (numeric or categorical):

1. VOLUME - how many assets of this exact type per month?
2. REPEAT - is the framing, subject class and output format identical each time? Give an example of the most different two instances.
3. LATENCY - what is the longest acceptable turnaround: overnight, minutes, or sub-second?
4. TOLERANCE - who reviews the output before a customer sees it, and what happens if a wrong asset ships?
5. PRIVACY - does any input or output contain an identifiable person or customer record? Which system holds it?
6. COST - what does this cost today per month, in staff hours and in dollars?

Also provide estimated automated monthly cost, per-asset ceiling, maximum turnaround and privacy rule. Use a table: field | value | unit | evidence. Mark missing facts UNKNOWN; never infer them. Identify a responsible person.

Pipeline specification template

```
USE CASE: <id> - <name>
1. SENSE      source=<catalogue asset | store camera | text prompt> resolution=<WxH>
rate=<per day>
2. REPRESENT  colour space=<BGR|RGB|HSV> working size=<WxH> store=<location>
3. ANALYSE    after candidate generation, measurement=<named metric> computed on=<what>
reference=<what it is compared against>
4. DECIDE     provisional threshold=<number> pass action=<...> fail action=<...>
5. ACT        publish reviewed output or loop to generate; output=<artefact> formats=<aspect
ratios> consumer=<team/system>
stage type = ANALYTICAL | GENERATIVE
```

Rejection rationale template

```
<case id> REJECTED. <criterion> scored <n>/5: <the number that caused it>. Revisit when <the
specific condition that would change that number>.
```

Example: NQ-04 REJECTED. Repeatability scored 1/5: every store event has a different subject, framing and copy deck. Revisit when the events team adopts a fixed three-layout template.
