

Lab 05 - Prompt and Specification Pack

Filtering, Enhancement and Restoration Measured with PSNR and SSIM Generative AI for Image and Video Creation (TGS-2020505925) | Version v11.0 | 6 September 2026

Enhancement is measurement work, so this pack holds the acceptance-gate wording and the prompt you would use to specify a generative restoration - including the honesty clause that stops a restored asset being passed off as an original capture.

Currency note. Model identifiers and API parameters quoted anywhere in this pack were verified against the official vendor documentation on 6 September 2026. Model IDs change; re-verify before relying on one. Identifiers known to be deprecated are marked as such rather than quietly removed, so you can recognise them in older material.

Enhancement acceptance gate (drop into the asset pipeline)

```
{
  "gate": "enhancement_accept",
  "reference": "the pre-degradation master, not the degraded input",
  "metrics": [
    {"name": "PSNR", "min_db": 30.0, "role": "catches gross error"},
    {"name": "SSIM", "min": 0.90, "role": "catches lost structure"}
  ],
  "rule": "example thresholds only; both must pass; disagreement routes to human review",
  "on_fail": "route to human review, do not auto-publish"
}
```

Generative restoration request

Restore the attached frame. Constraints:

- remove sensor noise and recover fine texture in the fabric weave;
- do NOT invent detail that is not implied by the surrounding pixels;
- preserve the subject silhouette, colour and all lighting direction;
- preserve the original aspect ratio and resolution.

Return the restored frame plus a statement of what was changed.

Provenance: the output is a RESTORED asset and must be labelled as such - it is not an original capture.

Super-resolution request with an honest acceptance clause

Upscale the attached 800x600 frame to 1600x1200.

Acceptance:

- PSNR and SSIM are computed against a true 1600x1200 capture where one exists;
- where no true capture exists, the output is reviewed by a human and labelled
UPSCALED - no numeric fidelity claim may be made against a reference that does not exist.

That second clause matters: super-resolution invents plausible detail. Reporting a fidelity score against the upscaled input rather than a real high-resolution capture is a meaningless number.
